towards new capital/i-n-d-j

Project to 2070: Food imports dried up 30 years ago when oil peaked at \$1,000 a barrel. Our new self-reliance has necessitated the development of dense enclaves of self-subsistence. Each enclave provides the optimum population density with the exact amount of energy and food. But how can we ensure our future without subjugating our culture and our quality of life? And at what cost? All desires, wants and needs are provided for, residences are highly coveted, a new super gated community. The ruinous city left behind serves only as a reminder to the failed, unsustainable, oil dependent urbanism of the 20th century.
